

ABSTRACT

A cambering vehicle includes a front column, and a bracket rotatably attached to the front column with a pivot shaft, a left and a right trailing arm each having a front portion pivotally attached to the bracket with a pivot axle which is preferably inclined relative to the bracket or the front column. A detachably latching device may be used to detachably latch the bracket and thus the trailing arms to the front column at the working position. The bracket and thus the trailing arm may be rotated relative to the front column to the folding position when the detachably latching device releases the bracket relative to the front column.
